Occupational Employment Statistics -- Sources and Data.

Bureau of Labor Statistics (Dept. of Labor), Washington, D.C.

Report No-R-305

Pub Date Jun 66

Note-91p.

EDRS Price MF-\$050 HC-\$4.65

Descriptors-Employment Level, \*Information Sources, \*Labor Force, \*National Surveys, \*Occupational Surveys, \*Statistical Data

Data on national employment for individual occupations and for selected industries are compiled. Short descriptions of the data sources are also given. Sections are titled (1) Occupational Data Based on Monthly Surveys of Households, (2) Occupation by Industry Statistics from Population Censuses, (3) Occupational Employment Data from Professional Societies, (4) Occupational Employment Data from Surveys of Employers, (5) Occupational Employment Data from Federal Regulatory Agencies, (6) Occupational Employment Data from the Federal Government, (7) Occupational Data from Wage Surveys, and (8) Local Area Occupational Information. Twenty tables give national employment data as reported from these several sources. The appendix contains tabular data for national employment in 1960-65 which was derived from sources other than the decennial census. (EM)

## PREFACE

This report brings together statistics from various sources on the numbers employed in individual occupations nationwide and in selected industries. Short descriptions of the sources of the data are also provided. The information should be useful to the growing number of researchers and technicians concerned with the changing occupational composition of the labor force and its implications for training programs, counseling, education, and manpower policy.

The report was prepared by Harry Greenspan and Joseph J. Kilgallon under the general direction of Cora E. Taylor, formerly Chief of the Bureau's Division of Occupational Employment Statistics, and Harold Goldstein, Assistant Commissioner for Manpower and Employment Statistics.

# OCCUPATIONAL EMPLOYMENT STATISTICS

## Sources and Data

### Introduction

Information on employment by occupation is increasingly important in the rapidly changing U.S. economy. Shifts in the demand for goods and services, combined with a changing technology of production, create a strong demand for some occupational skills and a lessening of the need for others. If the economy is to achieve a high growth rate, an adequate supply of workers whose skills match industry needs must be available. Conversely, if workers are to avoid unemployment they must have training in the skills which will be in demand. In order to project occupational requirements and supply so that training programs may be made available, it is necessary, among other tasks, to assess the current number of workers employed in each occupation.

Despite the need, statistics on employment in individual occupations are scanty, particularly in the 10-year intervals between population Censuses. The President's Committee to Appraise Employment and Unemployment Statistics recognized this and recommended "that the Bureau of Labor Statistics proceed to implement its proposed program of developing current employment statistics by occupation." <sup>1/</sup> The information in this bulletin was prepared as part of the exploratory work resulting from the Committee's recommendation.

A comprehensive plan to collect data from employers on the occupational skills of employees is being developed by the Bureau. Industries with relatively high concentrations of occupations requiring specialized training or extensive education are expected, according to present plans, to be surveyed on an annual or biennial basis. Other industries will be covered on a less frequent cycle. Under its new program, the Bureau, using the available statistical sources reviewed in this report and collecting additional data, plans to develop extensive information on employment in individual occupations on a current basis.

The information presented in this publication refers to estimates of employment by occupation for the Nation as a whole and in particular industries representing those which are available for recent years through 1965. Occupational data for local areas, though highly significant for such purposes as employment service operations, determining appropriate occupational training programs, and local economic development planning, are mentioned only briefly because they are not at this time useful in developing national estimates--the focus of this work. The statistics in this report, further, are limited to jobs held by civilians, and, therefore, do not include military personnel. <sup>2/</sup>

---

<sup>1/</sup> Measuring Employment and Unemployment, report of the President's Committee to Appraise Employment and Unemployment Statistics, pp. 202-205.

<sup>2/</sup> The Occupational Outlook Handbook, issued every 2 years by the BLS contains information on over 700 occupations--many more than this report covers. However, for many of these, the Handbook does not have statistics on the numbers employed, or includes only rough estimates.

Employment data for individual <sup>3/</sup> occupations are particularly useful if cross-tabulated by industry. Information on employment by industry is available promptly each month for about 275 sectors of the economy. If the occupational structure of these industries is known for some fairly recent period, the change in total industry employment can provide a good approximation of change in employment for most occupations. Further, historical series showing how the occupational structure of specific industries has been changing over time can be very helpful in estimating the future occupational composition of these industries, and the occupational requirements likely to arise from the anticipated growth or decline of each industry.

Although the information in this study was assembled to aid in planning a program of current occupational employment statistics, the report has been reproduced for circulation because it was believed that a description of existing sources of data would interest many individuals working with occupational statistics. In addition, the Bureau anticipates that circulation of the report may uncover useful sources of occupational data which were missed. To that end, readers who have information on occupational data not mentioned in this bulletin, or who observe any misinterpretation or inadequate description of the data included, are urged to communicate with the Bureau of Labor Statistics.

---

<sup>3/</sup> The use of the phrases "individual occupation," "specific occupation," or "particular occupation" in this report refers to occupations such as airplane pilot, typist and truck driver, generally occupations which require a distinct set of skills or abilities.

### Summary of Available Occupational Data

A resume of the sources of occupational employment statistics, of public or private origin, may help to orient many readers. This is provided in the paragraphs immediately following, while more comprehensive descriptions of each source and detailed statistics are contained in later sections.

The Employment and Earnings and Monthly Report on the Labor Force (EEMRLF) <sup>4/</sup> report issued by the Bureau of Labor Statistics, is the authoritative source of current estimates of total employment and unemployment for the Nation. It also provides estimates each month of total employment distributed among 20 occupational groups and a few specific occupations having sizable employment. Since these estimates of total employment are issued frequently and are current and complete, they are an important measure of the performance of the economy and constitute the best frame of reference against which to measure other data on employment by occupation. The occupational statistics in the report are based on a nationwide sample survey of about 35,000 households. A more inclusive description of the occupational data in that report, and selected statistics therefrom are provided on pages 6 to 15 of this report. <sup>4/</sup>

The Decennial Census of Population published by the Bureau of the Census, U.S. Department of Commerce, provides information which the Bureau collects on a sample basis concerning the occupations of persons in the labor force. The Population Census and the EEMRLF provide the only employment estimates which are complete for all classes of workers, including those in agriculture and other self-employed and unpaid family workers, as well as all wage and salary workers. Census tabulations for 1960 classify total employment into 297 occupations or occupational groups. The total in each occupation is cross-classified by other characteristics of the workers as described later in this report. Although information has been tabulated in greater occupational detail for some communities, and for some industries, the Census list of 297 occupations is the most detailed for which statistics have been published on employment by occupation for the entire Nation.

In addition to the EEMRLF, and the Population Census, which provide estimates for total employment, there are a number of sources of data on one or a few occupations, or on the occupational composition of particular industries. These sources may be summarized under five major headings as follows:

<sup>4/</sup> The EEMRLF report presents data, which prior to February 1966, were found in two publications--the Monthly Report on the Labor Force (MRLF) and Employment and Earnings.

Membership records and other statistics and reports compiled by professional societies (AMA and others) provide reasonably reliable annual or biennial data on employment in 11 professional occupations which had about 1.2 million workers in 1962. Most of the occupations are in the medical and health field.

Sample surveys made of employers provide estimates of employment in a limited number of important occupations. Such surveys, conducted by the Bureau of Labor Statistics, (originally in cooperation with the National Science Foundation) collect data on employment of scientists, engineers, technicians, and a few other occupations. Other agencies conducting similar surveys collect data on teachers, librarians, and policemen. Employment in the occupations covered by employer surveys was about 4.0 million in 1962.

Employment information filed with the Federal regulatory agencies (e.g., ICC or FCC), for railroads, telephone and telegraph companies, interstate motor carriers, pipelines, and airlines, is a source of useful data on employment in specific occupations for about 800,000 workers. Additional data on employment in broad occupational groups are also available for each industry concerned.

Reports issued by the U.S. Civil Service Commission on employment in the Federal Government provide occupational data for about 2.2 million Federal workers. For many of the employees, however, the published job titles do not permit clear-cut occupational classification without further investigation. About 500,000 Federal employees are in specialized occupations found only in the Post Office.

The Bureau of Labor Statistics surveys of occupational wage rates in metropolitan areas and in specific industries provide partial information on an additional 3 million to 4 million workers identified by occupation and industry. Most of the useful occupational data in these studies apply to occupations common to many industries, such as typists and other office clerical workers, skilled maintenance workers, and materials movement and custodial workers. Further investigation is necessary to evaluate the wage study data for their usefulness in developing estimates of employment by occupation.

In summary, estimates of total employment distributed among about 20 occupational groups and a few occupations with large numbers of workers are published on a current basis in the report, Employment and Earnings and Monthly Report on the Labor Force. In connection with the Decennial Census of Population, the Bureau of the Census collects information on employment, which is then tabulated for about 300 occupations or occupational groups cross-classified in about 150 industries. A variety of other sources of different types contain reliable data on employment by occupation for about 8 million workers; on an unduplicated, ready-to-use basis, however, the number reduces to about 5 million. Including EEMRLF estimates, employment data by individual occupation are available yearly, or every other year on an

unduplicated basis, for about 12 million workers, or 19 percent of total non-agricultural employment (in 1962). Detailed data are available for about 60 percent of all professional, technical, and kindred workers, 30 percent of the clerical workers, and smaller proportions of other groups. (See table 1.)

Only a small part of this information adequately specifies the industrial distribution of each occupation. The relatively scant information on the distribution of occupational employment by industry restricts the analytic use of the data in making current estimates, particularly if the data are not very recent, and in projecting estimates of requirements by occupation.

Table 1. Number and Percent of Nonagricultural Workers in Each Broad Occupational Group for Whom Employment Statistics are Available, by Individual Occupation, 1962

Broad occupational group <sup>1/</sup>	Number (in millions)	Percent of total employment in group
All groups - - - - -	<u>2/</u> 12.0	19
Professional, technical, and kindred workers - - - - -	4.9	61
Managers, officials, and proprietors - - -	.1	1
Clerical workers - - - - -	3.1	31
Sales workers - - - - -	--	0
Craftsmen, foremen, and kindred workers - -	1.2	13
Operatives and kindred workers - - - - -	2.4	20
Private household workers - - - - -	--	0
Other service workers - - - - -	.2	4
Laborers, except farm and mine - - - - -	( <u>3/</u> )	1

<sup>1/</sup> The term "broad occupational group" refers to the socio-economic occupational groups developed by the Census Bureau and used in both the EEMRLF and Census publications. The occupations included in each occupational group are listed in 1960 Census of Population Classified Index of Occupations and Industries. U.S. Department of Commerce, Bureau of the Census

<sup>2/</sup> Detail may not add to total because of rounding.

<sup>3/</sup> Fewer than 50,000.

The following sections briefly describe each source of occupational employment data and present the detailed statistics available for recent years.

## Occupational Data Based on Monthly Surveys of Households

The occupational statistics in Employment and Earnings and Monthly Report on the Labor Force (EEMRLF) are collected for the Bureau of Labor Statistics by the Bureau of the Census in its monthly sample survey of the population. The information collected from about 35,000 households by trained interviewers provides the basis for statistics on total employment, unemployment, employment by occupation, and other characteristics of the labor force. Since 1957, the household survey data have been tabulated to show total employment distributed to more than 20 occupations or occupational groups. Occupational estimates in somewhat less detail have been prepared since 1947. (See table 2.)

Between Census years, the monthly household survey statistics provide the only complete estimates of the number of persons in the labor force--those persons with jobs or seeking work. The self-employed and unpaid family workers, as well as those on payrolls, are included. <sup>5/</sup> The data on employment by broad occupational group provide the best means available for assessing the shift of employment from farm and blue-collar work to white-collar work. Because they are the only estimates of total employment made available frequently and on a current basis, they serve as a yardstick for measuring the relative importance (in numbers) of specific occupations or occupational groups for which employment data are obtainable from other sources. Statistics on trends in labor force participation by sex and age group are also the basis for projections of the number of persons who will be seeking work in future periods, and thus indicate the growth in job opportunities that will be needed to keep unemployment at an acceptably low level.

The monthly household survey provides estimates of the number of U.S. residents who are employed, but not of the number of jobs. Some persons work at two or more jobs; others work only part-time at a single job. Special studies made each year yield estimates of the number of workers holding more than one job, together with related statistics. In May 1964, about 3.7 million workers had two or more jobs.

In addition to employment totals, BLS in the EEMRLF publishes estimates of the composition of broad occupational groups by age, sex, color, marital status, unemployment status, duration of unemployment, and average hours worked per week. The Census Bureau, which operates the Current Population

0 <sup>5/</sup> For a discussion of the procedures underlying the household survey data, see BLS Report 279 and Current Population Reports, Series P-23, No. 13, Concepts and Methods Used in Household Statistics on Employment and Unemployment from the Current Population Survey. Issued jointly by U.S. Department of Labor and U.S. Department of Commerce, June 1964.

1/ Data for 1947-56 have not been adjusted to reflect changes in the definitions of employment and unemployment adopted in January 1957. On the average, total employment was lowered and unemployment raised by about one-quarter million as a result of the change. The change mainly affected nonagricultural industries, but its impact on any individual category would be relatively small.

Survey (CPS) on which the occupational data in the EEMRLF are based, also publishes data on the broad occupational groups cross-classified by such characteristics as geographic mobility and income, in Series P-20 and P-60, Current Population Reports.

Recently, annual averages of the monthly occupational data for 1963, 1964, and 1965 have been tabulated on an experimental basis at the detailed level used in the 1960 Census of Population publications, or for about 300 categories (occupations or occupational groups). The reliability and usefulness of the results depend on the sampling error, among other things. The standard error of the average of the 12 monthly estimates is about one-half of the error for the monthly estimates shown in table 3. For example, the chances are about two out of three that an annual average estimate of employment in an occupation of 250,000 persons would be within 12,000 of the results that would have been obtained by a complete count. If, for a particular use, a sampling error no larger than 5 percent is specified, only occupations employing 250,000 persons or more would be included. This level includes about 25 occupations, employing about 10 million workers in all, for which data are not now published in the EEMRLF or in other sources, and data on such a group should be an important addition to the information now available if the estimates are found suitable for release (table 4).

Table 3. Standard Error of Level of Monthly Estimates from the Household Survey 1/  
(In thousands)

Size of estimate	Size of error
10 - - - - -	5
50 - - - - -	11
100 - - - - -	15
250 - - - - -	25
500 - - - - -	34
1,000 - - - - -	48
2,500 - - - - -	75
5,000 - - - - -	100
10,000 - - - - -	140
20,000 - - - - -	180
30,000 - - - - -	210
40,000 - - - - -	220

1/ The standard error is a measure of sampling variability, that is the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are 19 out of 20 that the difference would be less than twice the standard error.

Attendants, hospital and institution - - - - -	392
Cooks, except private household - - - - -	562
Hairdressers and cosmetologists - - - - -	301
Janitors and sextons - - - - -	594
Kitchen workers, n.e.c., except private household - - -	304
Policemen and detectives - - - - -	252
Waiters - - - - -	825

1/ The employment estimates currently published in the EEMRLF applying to teachers (except those in colleges); stenographers, typists, and secretaries; carpenters; and to drivers and deliverymen, provide data, in the same or somewhat reduced detail. Other sources also provide estimates for engineers, nurses; and linemen and servicemen, telephone, telegraph, and power. Consequently, the net addition to the currently available information on employment by occupation is less than the sum of the employment estimates shown above.

Source: Decennial Census of Population, 1960.

Response error is also a serious problem in a survey which depends frequently on replies of one household member regarding the occupation of the other members--e.g., a housewife's response to a question of her husband's or son's occupation. The respondent may be poorly informed, answer imprecisely, or indulge in upgrading the Job: bricklayer helpers may become bricklayers, accounting clerks may become accountants, and machine tool operators may be upgraded to machinists. It is difficult to assess the importance of this response error in occupational estimates. The extent of the problem is indicated by information, obtained as a test, from employers of 2,000 respondents to the 1960 population Census which is discussed in the next section of this report on page 27. This test of Census occupational data throws some light on the occupational statistics in the EEMRLF as both sets of estimates are obtained by questioning householders.

Brief mention should be made of the industry employment statistics, also published in the EEMRLF, which are based on payroll data collected each month from employers, even though the statistics are almost entirely oriented to employment and related information by industry rather than by occupation. In these statistics, the division of employment in the mining and manufacturing industries into production and nonproduction workers, and in the construction industry into construction and other workers, provides a useful gauge of the changing importance of these broad occupational groups, in specific manufacturing and mining industries and in construction. The industry data now published in the EEMRLF, were published separately in Employment and Earnings prior to February 1966.

## Occupation by Industry Statistics from The Population Censuses

The major source of information on employment by detailed occupation for the United States has been data gathered during the decennial population censuses. In 1960, every fourth household was asked to supply information on the occupants' social and economic characteristics, including their occupation and industry of employment. Total estimated employment was classified into 297 occupations or occupational groups. The occupations were also cross-tabulated by industry for 149 sectors of the economy. Similar statistics on employment by occupation and industry were also prepared from data gathered during the 1950 Census. Detailed occupational estimates have been developed from the Census since 1870. <sup>6/</sup>

Nationwide data for 1960 were cross-classified in either complete or condensed occupational detail, with various characteristics of the worker or his employment, including the following.

- Age
- Sex
- Industry
- Area (regions, States, cities, Standard Metropolitan Statistical Areas, counties, State economic areas, and urban and rural areas)
- Class of worker (wage and salary, self-employed, and unpaid family workers)
- Employment status
- Race
- State of birth
- Educational attainment
- School enrollment
- Marital status
- Hours worked
- Weeks worked
- Earnings and income
- Year last worked
- Size of family
- Family relationship
- Rent of renter-occupied housing
- Place of work (central city, SMSA ring, outside of SMSA of residence)
- Mobility
- Nativity
- Parentage

---

<sup>6/</sup> For a discussion of census occupational statistics prior to 1950, see reports by Alba M. Edwards, Comparative Occupation Statistics for the United States, 1870 to 1940. U.S. Department of Commerce, Bureau of the Census, and by David L. Kaplan and M. Claire Casey, Occupational Trends in the United States, 1900 to 1950, U.S. Department of Commerce, Bureau of the Census.

Only a single table showing total employment in each occupation in 1950 and 1960 is included in this report (table 5). Of the many Census reports which deal with occupational data, one of the most useful for research into occupational employment is Occupation by Industry, which presents the distribution of detailed occupations for 149 industrial sectors of the economy. A number of tables with occupational data for the country as a whole, are in the three reports, Occupational Characteristics; United States Summary, Detailed Characteristics; and United States Summary, General Social and Economic Characteristics. Several of the Series (PC(2) reports present occupational data related to the specific topics such as earnings and education, school enrollment, educational attainment, mobility, nonwhite population by race, Puerto Ricans, and persons of Spanish surname.

In addition to national data, a great deal of information, including occupational data, is published for States and local areas in the Census reports for each State, in selected area reports, and in Census tract reports.

The Census is the only source of information on employment for a relatively detailed list of occupations which is complete for all types of work. The cross-classification of detailed occupation and industry data by the Census for 1950 and 1960 provides a highly useful framework for studies of current and projected employment by occupation. However, because of the nature of the household returns, the diversity and complexity of occupational data, cost restrictions, and the multipurpose requirement of decennial censuses, large blocs of workers are included under very general titles such as those shown below for blocs of 1 million or more.

<u>Census occupation titles</u>	<u>Employment in 1960 (in millions)</u>
Managers, officials, and proprietors (not elsewhere classified) - - - - -	4.5
Clerical and kindred workers (not elsewhere classified)	2.9
Salesmen and sales clerks (not elsewhere classified) - - - - -	3.7
Foremen (not elsewhere classified) - - - - -	1.2
Mechanics and repairmen (not elsewhere classified) - - - - -	1.2
Operatives and kindred workers (not elsewhere classified) - - - - -	4.6

The cross-classifications of occupations with industries, earnings, and education provide clues to the specific skill requirements of many workers tabulated under one or another of the general titles. For many of the clerical and sales workers, not elsewhere classified, the qualifications for employment uniformly required will be a grade school or high school education only. Nevertheless, the number whose work requires a high school education only, the number who must have some additional special training, and the

relative importance of different types of training, remain undifferentiated. Some other occupational categories in the Census, though not as clearly of a general nature as those listed above, likewise would include a variety of skills or skill levels. 7/ In addition to the non-specific character of important census occupational categories, the occupations of 3.2 million workers were not reported by respondents in the 1960 Census--a higher proportion than in earlier Censuses--and the estimate of total employment in the Census was about 1.5 million below that of the EEMRLF for April 1960. Thus, approximately one-third of all employment was not identified by specific occupation in the Census but was included in general categories, or was not reported by the workers.

Response errors, mentioned in connection with the occupational data in the EEMRLF, are also a serious problem in occupational statistics gathered from householders during the population censuses. A comparison of results from the two sources provides some indication of the extent of the problem. Occupational data for both the Census tables and the monthly statistics published in the EEMRLF are collected by the Bureau of the Census using the same system of occupational classification. The monthly estimates are based on data gathered by carefully trained and supervised interviewers. In 1960, much of the Census occupational information came from individuals in each household who filled out the questionnaire without assistance from Census personnel. However, the information on the population census was more often provided by the worker, rather than by the housewife or other person who may have been at home at the time the interviewer for the monthly survey called.

Comparison of Census and occupational estimates from the monthly household survey can be made only for occupational groups, since the monthly data are not tabulated at the detailed occupational level. Because of the 1.5 million lower total employment estimate and the 3.2 million workers whose occupation was not reported in the Census, the Census occupational estimates were, on the average, only 93 percent of those from the monthly survey. For a number of subdivisions in the professional, clerical, and skilled blue-collar groups, the Census and the monthly estimates differed by no more than 5 percent. For other groups, however, Census estimates ranged from 30 percent of the monthly household survey estimate for unpaid family workers on farms, to 113 percent for sales workers outside the retail trade. Table 6 contains a comparable data for 1960. It must be remembered that both sets of statistics were based on samples, the Census on a 25-percent sample of all households, the monthly statistics on a much smaller sample of 35,000 households. The sampling variance of the latter estimates is therefore much larger.

---

7/ Definition of each occupational category published by the Census is provided by means of a listing of the individual occupational titles which comprise the category. This information is shown in 1960 Census of Population Classified Index of Occupations and Industries, U.S. Department of Commerce, Bureau of the Census.

Unpaid family workers - - - - -	279	919	30

Among the tests of the accuracy of data collected during the 1960 Census was one in which replies to the Census on the occupations of the employed were compared with information from records of the employers. <sup>8/</sup> Employers of a subsample of about 2,000 persons (selected to represent 38.1 million workers) who were reported in the Census as employed were asked for information on the occupations of the individuals in the subsample. The Census report states ".... the employer responses on occupation are considered to be more accurate than those reported in the Census ...." <sup>9/</sup>

Table 7 compares estimated total employment in each occupational group on the basis of data from employer records and on the basis of reports to the Census for the identical workers. The greatest differences, relative to employer records, were the appreciably lower estimates in the Census for the managerial group and for laborers. Additional comparisons of the Census returns with employer records, together with information on the sampling variability of the results, are contained in the Census Bureau report on the study.

<sup>1/</sup> See U.S. Bureau of the Census. Evaluation and Research Program of the U.S. Censuses of Population and Housing 1960: The Employer Record Check. Series ER 60, No. 6 Derived from table 3. Excluded, in addition to the unemployed, are the self-employed, unpaid family workers, farmers and farm workers, private household workers, persons who did not provide information on industry in the 1960 census, and persons residing in Alaska and Hawaii.

<sup>2/</sup> Percents based on unrounded figures.

Census occupational employment estimates for 1960 may be compared with those of the MRLF (subsequently EEMRLF) and with employers records only at the occupational group level. The relative difference in estimate between the Census and the other sources of each occupational group is in effect an average of the differences for the detailed occupations which comprise the group. Consequently, if the sample permitted reliable comparisons for detailed occupations, the relative differences between the Census and the other sources would be larger for some of the detailed occupations than for the occupational group, and would be smaller for some other detailed occupations.

At present, statistics gathered at the time of the decennial census are the major source of information on employment in detailed occupations. Manpower planning and other programs, however, require detailed and reliable occupational information at more frequent intervals than provided by decennial censuses.

## Occupational Employment Data from Professional Societies

Professional associations often compile occupational employment data from licensure statistics or from their own membership records. Unfortunately, in many instances membership records provide only an incomplete count or may overlap membership in other societies. However, when a license is required to practice a profession, or general acceptance can only be gained by membership in a professional association, these sources usually provide reliable data. However, these statistics may overlap membership in other societies, include licensees in more than one State or some persons who, though members, are retired or inactive for other reasons, and may omit some persons who are employed but are not members of the professional society. Some occupations requiring licenses (e.g., real estate salesmen) are characterized by a high proportion of part-time or inactive personnel. In these cases, it is impossible to determine from licensure or membership records the number who are primarily employed in such occupations.

Of the 11 professional associations which compile reasonably complete and accurate employment data for their profession, 6 are concerned with health occupations. None of the professional societies estimates the employment distribution by industry for their occupation, but some of the health occupations are distributed by type of practice. This provides some insight into industry distribution. Data available from licensure statistics and professional society membership records concerning employment in health occupations are periodically assembled and analyzed in reports prepared by the U.S. Public Health Service. The following table gives employment estimates and sources of data for 11 occupations. These occupations are heavily concentrated in only one or two industries.

Table 8. Occupational Employment Data Available from Professional Associations

Occupation	Employment in thousands				
	1960	1961	1962	1963	1964
Health professions:

Foresters <u>11/</u> - - - - -		18			

1/ Distribution of Dentists in the United States, by State, Region, District, and County, various editions, an annual report of the American Dental Association based on a count of dentists listed in the American Dental Directory. The employment estimate excludes military and retired personnel.

2/ Facts About Nursing, various editions, an annual report of the American Nurses' Association. The interagency Conference on Nursing Statistics, including representatives of the American Nursing Association, the National League for Nursing, and the U.S. Public Health Service, meets biennially to prepare a joint estimate based on their data and on records, registration data, and employment data obtained from the American Hospital Association, American Osteopathic Association, State Boards of Nursing, American Red Cross, National Student Nurses' Association, National Federation of Licensed Practical Nurses and the Bureau of Labor Statistics.

3/ Data furnished annually by the National League for Nursing on enrollment in basic programs of professional nursing schools in U.S. and Puerto Rico.

4/ A Statistical Study of the Osteopathic Professional, an annual report of The American Osteopathic Association. Data exclude the retired and those for whom status was not reported. Note: Approximately 2,200 osteopaths in California were awarded M.D. degrees in 1962, thus decreasing the number of Doctors of Osteopathy in that State.

5/ N.A.B.P. Bulletin, National Association of Boards of Pharmacy. Employment Statistics are compiled annually in the winter edition. They represent a count of registered pharmacists engaged in practice obtained from N.A.B.P. census and licensing data.

6/ A.M.A. Directory Report Service, a quarterly report of the American Medical Association. Data are as of the end of each year shown and have been adjusted to delete military and retired M.D.'s and M.D.'s other than those in Federal employ who have a temporary foreign address.

7/ American Podiatry Association reports based on State licensing: Podiatry as a Career, by Wilfred E. Belleau revised 1965 edition for 1962 data; Numbers and the Podiatry Professions, by Lloyd E. Blauch, for 1963 data, and Journal of the American Podiatry Association: March 1965; "1964 Survey of the Podiatry Profession: The Podiatrist: Distribution Education, Organizational Relationships," by Lloyd E. Blauch.

8/ A.V.M.A. Directory, a biennial publication of the American Veterinary Medical Association. The statistics give a reasonably reliable estimate of employment after adjustment for retired veterinarians.

9/ An unduplicated count of the membership of this Society of Actuaries, the Casualty Actuarial Society, Conference of Actuaries in Public Practice, and the Fraternal Actuarial Association, as well as qualified nonmembers (primarily consultants). All foreign and retired actuaries have been deleted from the count.

10/ Data are an unduplicated count of architects registered in each State, compiled by the National Council of Architecture Registration Boards, Architectural Institute of America. Some retired registered architects may be included.

11/ Journal of Forestry, July 1962, published by the Society of American Foresters. "How Many Foresters," article by F.H. Eyre. Data are from a survey of alumni by colleges granting degrees in forestry, plus a count of the nondegree members of the Society of American Foresters. No similar study is planned for the immediate future.

## Occupational Employment Data from Surveys of Employers

### Scientists, Engineers, and Related Technicians

In the last 15 years, the demand for technologically advanced goods for defense, the tremendous expansion of space research, and the growth of research and development for private industry, have focused a great deal of attention on the requirements for and supply of scientists, engineers, and technicians. To obtain information on the employment of these highly trained workers, mail surveys of employers in various sectors of the economy were inaugurated. In 1954, 1957, and annually since 1959, the Bureau of Labor Statistics conducted surveys of scientific and technical personnel employed in private industry. The Bureau also gathered data on the employment of scientific and technical personnel employed by State governments in 1959, 1962, and 1964 and expects to repeat the survey regularly. A survey of local governments was made in 1963.

Estimates of scientists, engineers, and technicians employed in colleges and universities are obtained from surveys of institutions of higher education conducted by the National Science Foundation; and the employment of scientists and engineers in the Federal Government can be derived from Civil Service records.

The National Science Foundation, which is charged with developing information on scientific and technical personnel, also maintains a National Register of Scientific and Technical Personnel, for scientists and engineers employed in all segments of the economy. The data are obtained for the Foundation by contract with professional scientific societies, each of which is responsible for coverage of scientific occupations. Registrations are secured on a voluntary basis by the societies, using standard questionnaires and scientific and engineering specialties lists.

Statistics have been published for physical and life scientists. <sup>10/</sup> In 1964, coverage was expended to include professionals in the fields of economics, linguistics, and sociology. The Foundation's register provides information on the characteristics of U.S. scientists in terms of their education, areas of specialization, salaries, and geographic locations, and is the major source of data on detailed fields of specialization within broad fields such as biology, physics, etc. However, the register's estimates of total employment in scientific and technical occupations may be subject to significant error. As stated in the foreword of the report made by the National Science Foundation on manpower in 1962: "The information on individual scientists, collected by the National Register on a voluntary basis, constitutes partial coverage of the universe of scientific and technical personnel." <sup>11/</sup> Some qualified scientific and technical personnel

<sup>10/</sup> American Science Manpower 1962, A report of the National Register of Scientific and Technical Personnel, National Science Foundation, 1965.

<sup>11/</sup> Ibid, p. iii.

also 1966, 67, 68

who are not members of the societies reporting may be unintentionally omitted. Further, an unknown bias results from the voluntary registration procedure. The Foundation plans to explore the extent and character of the bias in order to take steps to reduce it.

The National Science Foundation's recent publication, Scientific and Technical Manpower Resources, <sup>12/</sup> brings together from various sources a wealth of material on scientists, engineers and technicians. In addition to information on the employment of, and demand for these personnel, the NSF report discusses utilization of scientists and engineers in research and other activities, their geographic distribution, education, foreign language proficiency, and income.

Scientific and Technical Personnel in Private Industry.--The major employment of these highly trained workers is in private industry. The BLS surveys of such employment have been improved and modified as experience has been gained in conducting this type of inquiry; and the surveys therefore, are not strictly comparable over the 10-year period. In the 1954 and 1957 surveys, scientists and engineers employed as administrators were not identified specifically as engineers or by scientific specialty. However, an attempt has been made to adjust the 1954 data for scientific specialty. Up to 1961, the sample was selected on a company basis, stratified by industry and size of employment. The desirability of selecting the sample on an establishment rather than a company basis had been well recognized but was not considered feasible prior to 1961. Many of the large companies which operate plants classified in a number of different industries could not identify their scientific and technical personnel by industry because of recordkeeping practices or other reasons. Although the survey sample was selected on an establishment basis beginning in 1961, some reports from multiplant companies are still received on a companywide basis and present difficult problems in assigning sample weights.

The number of establishments in the sample has increased moderately over the period, and beginning with the survey planned for 1966, the sample will be greatly expanded. However, for earlier years, the sampling errors for the smaller estimates are relatively large and explain, in part, variations in those figures which appear to be inconsistent with long-term trends. The smaller numbers should be considered as giving a reasonable estimate, but not a fully satisfactory indication of year-to-year changes.

<sup>12/</sup> Scientific and Technical Manpower Resources, Summary Information on Employment, Characteristics, Supply and Training, NSF 64-28. National Science Foundation, 1965.

Scientific and Technical Personnel Employed by the Federal Government.-- Periodically, the Civil Service Commission requests information from Federal agencies on the distribution of full-time civilian employees by occupation. Reports are submitted by most agencies and provide extensive detail on Federal civilian positions. Through 1961, two pamphlets were published from these data--Occupations of Federal White-Collar Workers and Occupations of Federal Blue-Collar Workers. <sup>13/</sup> Scientific, engineering, and technician disciplines are included in the large number of occupations enumerated in these reports. Data for these selected occupations are also published in a National Science Foundation report entitled, Scientific and Technical Personnel in Federal Government.

In Government, some variation exists in the definition of the scientific and technical occupations included in reports from several agencies. Moreover, the classification program continues to keep abreast of changing technology. Some occupational categories are discontinued and new ones are introduced which are not necessarily comparable with those they replace. Despite these problems relating to the consistency and definition of occupations, summaries of Federal Government occupational data provide a reliable accounting of Federal civilian employment in the scientific, engineering, and technical fields.

Scientific and Technical Personnel Employment by State Government.--In conducting State government surveys of scientific and technical personnel, mail questionnaires are sent by the BLS to State agencies except those primarily concerned with teaching, or with judicial or legislative functions. These are not sample surveys; questionnaires are sent to all agencies included in the universe. The surveys provide a distribution of scientists, engineers and technicians by type of agency. In 1962, civil engineers were listed separately from the total engineering category. In 1964, data were collected for civil and sanitary engineers as well as for all engineers.

Scientific and Technical Personnel in Colleges and Universities.--The National Science Foundation has been particularly interested in the significant increase occurring over the past decade in the number of scientists and engineers employed by colleges and universities. In 1961, in an effort to keep abreast of this development, it conducted a sample survey of more than 2,000 accredited institutions of higher learning, including Federal contract research centers operated by universities and covering graduate students as well as full- and part-time faculty and non-faculty staff. No attempt was made to inflate the data to account for nonrespondent institutions which were considered "distinctive organizations." Data on these nonrespondents were therefore omitted. On the aggregate, it is estimated that these omissions reflect less than 5 percent of the total full-time equivalents of employed professional staff engaged in scientific and engineering activity in all

---

<sup>13/</sup> Civil Service Commission data are described more fully on p. 52.

colleges and universities. The results of this study were published in a report entitled Science and Engineering Professional Manpower Resources in Colleges and Universities, 1961 NSF 65-8 (1964). A similar study for 1965 is being prepared for publication.

The following table combines 1962 employment data for scientists, engineers, and technicians obtained from the sources described above. Data for other years for each segment of the economy may be obtained from the appropriate source.

Table 9. Employment of Scientists, Engineers, and Technicians, 1962

Other technicians - - - - -	102.4	100.9	--	1.5	

Footnotes

1/ The total does not include scientific and technical personnel who are self-employed or who are employed by local governments, nonprofit organizations, and very small companies not covered by the private industry sample survey. In 1961, private foundations employed 650 scientists and engineers full-time.

2/ Includes all full-time employees (faculty and nonfaculty) and graduate student assistants. Part-time employees are excluded as it is assumed that employment with colleges and universities is not their primary job.

3/ In 1961, a number of employees of the National Aeronautics and Space Administration were reclassified from aerospace engineer to general physical scientist. In 1962, many of these were returned to the engineer group.

4/ Information on physicists was not requested separately in the State government survey.

5/ All "earth scientists" reported as employed by colleges and universities are classified as geologists and geophysicists in this table.

6/ Information on metallurgists was not requested separately in the surveys of State government and institutions of higher education.

7/ Includes 3,000 biochemists designated as "life scientists" and excludes 400 pathologists considered medical practitioners.

8/ The Civil Service data made no distinction between medical practitioners and medical scientists. In 1961, about 15.7 thousand medical and dental officers, pharmacists, optometrists, etc., were employed by the Federal Government. Of this number, approximately 14.5 thousand were employed by two agencies--the Veterans Administration and the Department of Health, Education and Welfare. Both of these agencies employ large hospital staffs, as well as research and related personnel.

9/ Excludes 3,900 clinical scientists who are considered medical practitioners.

10/ The NSF did not obtain data on technicians.

## Teaching and Related Professions

The U.S. Office of Education collects information on a variety of educational subjects including data on the employment of teachers and related personnel.

In its 1965 report, Projections of Educational Statistics to 1974-75, the Office of Education published annual estimates of the number of elementary and secondary school teachers employed in public and nonpublic schools during the school years for the period 1954 to 1964 and projections to 1974-75. Some of these data are also published in its annual Digest of Educational Statistics. The statistics are based on a count of teaching positions in each State public school system submitted by State Superintendents of Education. Data for nonpublic schools are estimated by the Office of Education, using information from various sources. As these statistics are estimates of teaching positions, they exclude substitute teachers. Principals, supervisors, and administrative personnel are also excluded. Librarians, guidance and psychological personnel are included when not reported separately. The data contained in this 1965 report differ from the EEMRLF estimates (table 2), since the latter include substitute teachers if they worked during the reporting period, principals and some administrative personnel, and teachers employed in specialized vocational schools not affiliated with elementary and secondary school schools, in its estimate for teachers, except college.

Employment data for college instructors and faculty are collected biennially by the Office of Education by means of a questionnaire mailed to all known institutions of higher education, including junior colleges. The survey results are published biennially in the report, Faculty and Other Professional Staff in Institutions of Higher Education. The most recent report was issued in 1965, and covers data for the first term of 1961-62. The data are also contained in the Digest of Educational Statistics, and Projections of Educational Statistics to 1974-75. The latter also provides employment estimates for nonsurvey years. Part-time instructors and graduate student assistants, as well as full-time instructors, are included in the survey data and nonsurvey estimates.

The Digest of Educational Statistics also presents annual estimates of the number of librarians employed in public and nonpublic elementary and secondary schools, colleges and universities, and in public libraries and special libraries. The estimates are derived from surveys of libraries of certain sizes and categories and from estimates based on population and school enrollment. Employment is expressed in terms of full-time equivalents and, therefore, includes part-time professional librarians. Some 15,000 to 20,000 partly trained part-time librarians have been excluded from the estimates. The Civil Service Commission, in its report Occupations of Federal White-Collar Workers, cites the number of librarians employed by Federal Government agencies. The Office of Education includes these librarians in its special libraries category.

<sup>2/</sup> Ibid, table 25. Data cover only faculty for resident instruction in degree-credit courses. They do not include professional staff for general administration, student personnel services, or organized research; faculty for resident instruction in other than degree-credit courses; extension staff; professional library staff; instructional staff for elementary or secondary instruction; and other faculty. Data for 1960-61 and 1962-63 are estimates.

<sup>3/</sup> Digest of Educational Statistics, 1965 edition, U.S. Department of Health, Education and Welfare, Office of Education, publication #OE-10024-65, table 128.

In 1963, the Office of Education conducted a 10-percent sample survey of full-time college teaching staffs, designed to provide a basis for estimates of the number of college teachers by primary subject (teaching area). Although data were obtained for each teaching field (table 11), they are representative only of universities, liberal arts colleges, and independently organized teachers colleges and technological institutions. Theological schools, schools of art, miscellaneous independent professional schools offering programs in medicine, law, business, pharmacy, etc., and junior colleges were excluded. The findings from this study were published in a 1964 report entitled Teaching Faculty in Higher Education, 1962-63: Primary Teaching Areas and Contract Salaries.

## Social Welfare Workers

In 1960, a report <sup>14/</sup> on the estimated number of social welfare workers, including recreation workers, was prepared from a survey of social welfare agencies. The estimated 116,000 persons employed in 1960 were distributed among the following types of agencies.

State and local government agencies - - - -	69,500
State and local voluntary agencies - - - -	39,600
Federal government agencies - - - - -	4,000
National voluntary agencies - - - - -	2,600

About 30 percent of the social welfare workers were employed in public assistance programs and a large number were also engaged in child welfare work, as shown below. The report also provides information on a number of other characteristics of social welfare work.

Total - - - - -	1/115,800
Public assistance - - - - -	35,200
Other family services - - - - -	8,600
Child welfare work - - - - -	32,900
Rehabilitation services - - - - -	2,500
Medical social work - - - - -	3,400
Psychiatric social work - - - - -	5,200
Services to adult offenders - - - - -	5,300
Services to aged in institutions - - - - -	800
Group work - - - - -	10,900
Community organization - - - - -	7,600
Teaching social work - - - - -	900
Recreation programs - - - - -	10,400

<sup>1/</sup> Includes data for programs in addition to those shown separately.

<sup>14/</sup> National Social Welfare Assembly, Inc. Salaries and Working Conditions of Social Welfare Manpower in 1960, a survey conducted by the U.S. Department of Labor, Bureau of Labor Statistics, in cooperation with the National Social Welfare Assembly, Inc., and the U.S. Department of Health, Education, and Welfare.

## Policemen and F.B.I. Agents

The Federal Bureau of Investigation, as a part of its program to help coordinate the efforts of all law enforcement agencies, compiles and can provide an estimate of the number of policemen employed in city and county police departments which submit such employment data to the F.B.I. Upon request, the Federal Bureau of Investigation can also provide an estimate of the number of F.B.I. agents employed at a specific time.

Table 12. Employment of Policemen and F.B.I. Agents, 1960-64

Occupation	Employment (in thousands)				
	1960	1961	1962	1963	1964
City and county policemen <sup>1/</sup> - - - - -	176	176	180	182	181
F.B.I. agents - - - - -	--	--	6	6	6

<sup>1/</sup> Crime in the United States, an annual summary of the Uniform Crime Reports submitted to the F.B.I. The number of full-time police officers employed by city and county police departments is calculated from data on the number of full-time police department employees. Since this source does not cover cities of under 2,500 population and is concerned only with full-time personnel, the employment figures shown above are less than a full count.

## Employment by Occupation on Oceangoing Ships

The Maritime Administration, U.S. Department of Commerce, published job distributions for officers and unlicensed personnel aboard active oceangoing ships of 1,000 gross tons or over in supplements to its 1959 and 1960 maritime manpower reports. Although employment on these ships represents only about 60 percent of total employment in the deep sea transportation industry, the occupations specified are found almost exclusively on shipboard and are not likely to be associated with land-based operations. The occupational employment estimates in these reports are, therefore, considered to be reasonably accurate for the positions covered. However, the supplemental reports have been discontinued and similar reports are not planned for the next few years.

The 1959 and 1960 data are summarised in table 13.

Table 13. Employment in Selected Occupations on Oceangoing Ships <sup>1/</sup>

Occupation	Employment (in thousands)	
	Jan 1, 1960	Jan. 1, 1959
Total employment - - - - -	47.0	51.6
Master and deck officers - - - - -	4.5	4.7
Seamen and bosun mates - - - - -	11.0	12.1
All other deck department personnel - - - - -	1.8	1.8
Staff department personnel - - - - -	.9	1.1
Engineers - - - - -	5.3	5.6
Electricians - - - - -	1.1	1.5
Oilers and wipers (engine-room) - - - - -	8.3	8.5
All other engine department personnel - - - - -	1.3	1.4
Messmen and galley utility men - - - - -	5.9	6.6
Cooks and bakers - - - - -	2.8	3.3
All other catering and galley personnel - - - - -	4.0	5.1

<sup>1/</sup> Limited to ships of 1,000 gross tons or over. Excludes MSTs Civil Service-manned and contract-operated tankers.

## Occupational Employment Data from Federal Regulatory Agencies

Mandatory reports filed with Federal regulatory agencies usually provide reliable employment data for broad occupational categories within specific regulated industries. Usable data for a number of specific occupations, particularly those unique to the regulated industries, may also be obtained from these reports. Reports are required from interstate airline, railroad, telephone, telegraph, pipeline, and trucking firms. Except for trucking, the interstate portion of each of these industries includes a high proportion of total employment in the industry and the reported occupational data are, therefore, relatively complete for each industry. However, the broad occupational classifications included in these reports are usually geared to divisions of work (e.g., flight personnel, platform employees, etc.) and are not consistent with generally accepted occupational classifications (e.g., Census). Nevertheless, the employment trends in the broad occupational categories may give an indication of the change in employment of the specific occupations within the categories.

The Interstate Commerce Commission (ICC) receives reports from Class I railroads which include monthly employment data, annual averages for 128 occupational divisions, and average annual employment estimates for several occupational categories reported by the Pullman Company and the Railway Express Agency, Inc. The combination of these three reports covers about 94 percent of total railroad employment. Many of the job classifications, however, are not limited to a single occupation. For example, the railroad industry occupation "carmen" includes painters, upholsterers, welders, patternmakers, and mill machine operators. Although the ICC employment data for a number of occupations may be comparable to Census classifications, such data are most useful for providing a total employment count for "railroad" occupations such as railroad conductors and locomotive engineers. In this bulletin, the detailed ICC occupational data have been reclassified into estimates for broad occupational groups similar to the Census classification system. These are shown, together with data for selected detailed occupations, in table 14. The ICC also receives annual reports from interstate oil pipeline companies and interstate property and passenger motor carriers. Reports for the oil pipeline industry cover the entire Federally regulated industry. <sup>15/</sup> In contrast, interstate property and passenger motor carriers account for only a fraction of the employment in their respective industries.

---

<sup>15/</sup> Unregulated (intrastate) operations which involve roughly 13 or 14 percent of the oil pipeline mileage, according to the Bureau of Mines surveys, are not covered.

The Federal Communications Commission and the U.S. Independent Telephone Association publish annual reports which contain employment information for broad occupational categories and a few selected occupations within the telephone industry. The combination of the two reports covers all telephone industry employment except for officials and managerial assistants employed by the Bell System. In addition, the FCC publishes occupational employment data (except for officials and managerial assistants), which cover all companies in the telegraph industry with annual revenues exceeding \$50,000. The number of employees covered by these data represents about 90 percent of telegraph industry employment.

The Federal Aviation Agency provides an annual count of pilots and stewardesses employed by U.S. Civil Air Carriers. It also separates the remainder of the total employment in this industry into a few broad occupational categories. The scheduled airlines covered by FAA statistics account for four-fifths of the employment in the air transportation industry. The FAA also reports, on a semiannual basis, the number of air traffic controllers which it employs. These workers represent a portion of the Census occupation "radio operators." The employment for selected occupations found in regulated industries is shown in table 14.

Footnotes

- 1/ Some broad categories include data not shown separately.
- 2/ Calendar year issues of Statement No. M-300: Wage Statistics of Class I Railroads in the U.S., Interstate Commerce Commission, Bureau of Accounts. Data are compiled from monthly reports submitted to ICC covering operations of 78 Class I railroads having annual operating revenues of \$5,000,000 or more. The Statements include employment statistics for 128 reporting divisions (occupational categories), many of which are not limited to a single occupation.
- 3/ Annual issues of Transport Statistics in the U.S., Part 3, The Railway Express Agency, Inc., Interstate Commerce Commission, Bureau of Transport Economics and Statistics.
- 4/ Ibid., Part 2, The Pullman Co.
- 5/ Ibid., Part 6, Oil Pipelines.
- 6/ FAA Statistical Handbook of Aviation, 1964 edition (issued in 1965); published annually by the Federal Aviation Agency. Compilations are based on payroll data submitted to the Civil Aeronautics Board covering all employees of scheduled airlines. The Air Transport Association of America publishes the same data each year in Facts and Figures - Air Transportation.
- 7/ ATS Fact Book, Federal Aviation Agency, Air Traffic Service; published semiannually. Employment for air traffic controllers are obtained from Air Traffic Service personnel records.
- 8/ Industry Wage Survey: Communications, published annually by the U.S. Department of Labor, Bureau of Labor Statistics. The data are compiled from annual reports filed with the Federal Communications Commission by Class A telephone carriers (companies with annual revenues exceeding \$250,000). The Annual Statistical Volume, published by the U.S. Independent Telephone Association, presents employment data compiled from an annual survey of independent telephone companies. The data shown above represent an unduplicated combination of the two studies. The total employment estimate does not include officials and managerial assistants employed by the Bell System.
- 9/ Industry Wage Survey: Communications, published annually by the U.S. Department of Labor, Bureau of Labor Statistics. The data are compiled from annual reports filed with the Federal Communications Commission by all companies in the telegraph industry with annual revenues exceeding \$50,000.

Note: Because of rounding, sums of individual items may not add to totals.

## Occupational Employment Data for the Federal Government

The U.S. Government is the largest single employer in the country. It not only employs more people than any large corporation, but it employs them in a wider variety of occupations. Most of the occupations found in private industry are also present in the Federal Government, and some of those found in Government are unique. In 1964, Federal employment averaged 2,300,000.

The U.S. Civil Service Commission compiles employment data by occupation for all Federal employees except military personnel. However, many of the 1,300 civil service occupational classifications are not compatible with commonly accepted occupational definitions (e.g., Census). Often they cover more than one occupation and sometimes cut across occupational group lines. This problem probably can be satisfactorily resolved in consultation with agency and civil service personnel, by utilizing grade level information reported for civil service classifications to allocate employment between distinct occupations or occupational groups.

In January 1965, the Civil Service Commission began publication of semi-annual statistical tabulations of employment and labor turnover for a broad sample of selected white-collar, blue-collar, and postal occupations, based on a 10 percent sample of Federal employees. In the second report in the series, referring to December 1964, data were provided for 140 Federal white-collar occupations, representing approximately 85 percent of total nonpostal white-collar employment. <sup>16/</sup> For 1962 and earlier years, the Commission published Occupations of Federal White-Collar Workers. For 1961 and earlier years, the Commission also published Occupations of Federal Blue-Collar Workers. These publications contain employment information by detailed occupation for major Federal agencies.

Table 15 gives employment data for several selected occupations. Detailed data are shown only for those occupations which appeared to present no difficult classification problems, and which also included employment of 10,000 or more workers. Scientists, engineers, and technicians employed by the Federal Government are shown in table 9.

See footnote on next page.

Footnote

1/ Except for Post Office occupations, these data are compiled from publications and unpublished tabulations of the U.S. Civil Service Commission. Data for white-collar workers were published annually by the Commission through 1961 and for blue-collar workers through 1960 in Occupations of Federal White-Collar Workers and Occupations of Federal Blue-Collar Workers. Data on blue-collar workers for 1961 and all data for 1962 and later are from unpublished records of the Civil Service Commission. Data through 1962 refer to October 31 of each year and include only personnel stationed in the United States. Data for 1964 refer to December 31, 1964, and include in the totals Federal white-collar workers stationed outside the United States because such workers could not be extracted from the statistics. (In 1961, less than 3 percent of all Federal white-collar workers were stationed outside the United States.) The Civil Service Commission did not prepare summary tabulations of employment by occupation in 1963.

Information on Post Office occupations was obtained from a monthly report prepared by that agency's Bureau of Finance and Administration. Data refer to October of each year.

Information on employees of the Board of Governors of the Federal Reserve System, members and employees of the Congress, and employees of the Central Intelligence Agency and the National Security Agency are excluded because data are not available.

## Occupational Data from Wage Surveys<sup>17/</sup>

In carrying out its responsibilities for providing information on wage rates by occupation, the Bureau of Labor Statistics incidentally collects data which should prove useful for making estimates of employment for a number of occupations in major sectors of the economy. Through the Community Wage Surveys (CWS), field representatives of the Bureau gather information on total employment and on the number of workers at various wage rates for about 40 occupations common to many industries. The occupations are largely those found in office clerical, skilled maintenance, materials movement, and custodial work (table 16). Separate surveys provide data for a few professional, administrative, and technical occupations. In addition, Industry Wage Surveys (IWS) yield information on detailed specific production worker occupations for a number of industries.

### Community Wage Surveys

Since 1961, the Community Wage Survey program has been operated through annual sample surveys of establishments in at least 80 metropolitan areas. The areas are chosen to be representative of all 212 (1961) Standard Metropolitan Statistical Areas (SMSA). Within each area, the sample is stratified by industry and size of plant. About 12,000 establishments are contacted each year. The field agents used in this program become experienced in classifying employees into the occupations covered by the surveys, and on their visits review job information supplied by each establishment to determine the number employed, by wage rate, in each occupation.

Employment in the establishments from which the Community Wage Survey sample is drawn was estimated to be 17 million in 1961; one-fourth of all employment in the United States. About 2.8 million workers, 17 percent of all employment covered by the CWS, and 4 percent of total employment in the economy, were identified by occupation (table 16). Major portions of many of the manufacturing, transportation, and other industries are surveyed (table 17). The sample is stratified within communities, by 2-digit SIC industries, and by size of establishment (number of workers).

---

<sup>17/</sup> The information on occupational data from wage surveys is based on statistics and reports prepared by the Division of Wages and Industrial Relations of the Bureau of Labor Statistics.

<sup>1/</sup> Establishments with 50 or more employees, except in a few of the largest cities in which the minimum employment for most industries is 100.

<sup>2/</sup> From BLS payroll employment series. Includes employment in mining, contract construction, selected service industries, and government which are not shown separately because they are not covered in the wage surveys.

<sup>3/</sup> Includes service industries not shown separately because they are not covered in the wage surveys.

Note: Because of rounding, sums of individual items may not equal totals.

The major problem in using the CWS data as an aid in analyzing occupational employment levels and trends is the difficulty of determining the relation of the CWS occupational estimates to total employment in each occupation, nationally and in specific industries. Excluded from the CWS are all workers outside of metropolitan areas and workers in small-size plants. The minimum size of establishment included in the CWS varies from 50 to 100 employees, depending on the area and industry. Also excluded are establishments in the agriculture, mining, and construction industries, and all government employment. Since the survey depends on payroll information, the self-employed are not included. Because of the exclusion of small establishments and of the self-employed, many of the industries in the service sector are covered only sparsely.

Though useful as estimates of employment and changing occupational proportions in medium- and large-size plants in metropolitan areas, the CWS occupational data would be of greater help to the manpower analyst if converted to an annual series of estimates of total employment in each occupation in specific industries. A rough approach to estimates of total employment in each of the approximately 40 occupations could be made for a number of industries by using the CWS data as occupational ratios (the percent of total employment in the plant represented by a particular occupation) for specific industries. The ratios could then be applied to estimates of total U.S. employment in each industry as reported in the BLS payroll employment series. This approach would be relatively satisfactory for those industries in which the CWS coverage is a large proportion of the total. For example, in the manufacturing group, the employment coverage of the CWS ranges from 75 to 90 percent of the total for the petroleum refining, rubber and miscellaneous plastic products, machinery, primary metal products, transportation equipment, and ordnance and accessories industries. However, even in the industries in which the CWS coverage is a high proportion of the total, there is likely to be a bias toward high estimates of white-collar employment and low estimates of blue-collar, due to the concentration of the surveys in metropolitan areas and the exclusion of small-size plants. Large establishments in metropolitan areas are more likely to maintain central offices and to engage in extensive recordkeeping and research than are the smaller nonmetropolitan area establishments.

However, for illustrative purposes, the recognizing the drawbacks mentioned, rough employment estimates were derived in the manner just described. Data were prepared only for those manufacturing industries with at least 75 percent of total industry employment located in metropolitan areas and in the size groups from which the CWS sample is drawn (table 18).

1/ Less than 50.

2/ Except in tool and die jobbing shops.

Note: Because of rounding, sums of individual items may not equal totals.

A better way to make use of CWS data for occupational estimates would be to develop occupational ratios by size of plant classes for each industry, and apply these ratios to estimates of total employment in each size class. Estimates would still have to be made of the occupational ratios for small-size plants, but these would be more firmly based if the variation in ratio by size class were available for the larger plants. The occupational ratios should be prepared by detailed industry--at the 4-digit SIC level, if possible. However, the computation difficulties in carrying out this approach have not been fully explored, and CWS data will be sparse and subject to large sampling error in some of the industry size-of-plant cells. The pattern of occupational ratios by size of establishment for the larger establishments may prove of little value in estimating occupational ratios for the smaller establishments.

For the manufacturing industries, an additional guide is available to adjust the CWS data. In both the CWS and the BLS payroll employment series, employment of production workers, as well as total employment is reported. The same definition of production workers is used in both series. The production worker group is almost entirely comprised of blue-collar plant workers and service workers. A production worker ratio in the CWS which is lower than that in the nationwide BLS payroll series would indicate, for all production worker occupations, the extent of the bias due to the concentration of the CWS in metropolitan areas and large-size plants.

In addition to the desirability noted above of adjusting the CWS sample of establishments to refer to a larger--possibly complete--set of establishments, including small plants in SMSA's and plants outside of SMSA's, it would be desirable to evaluate the completeness of the CWS occupational count within visited establishments. An undercount, of unknown importance, is present in employment information derived incidentally to the collection of wage rates. Handicapped workers, part-time and temporary workers, beginners, and others who might be subject to special rates of pay are excluded from the count shown for specific occupations but not from total employment in the establishment. For purposes of estimating employment in each occupation, these groups should be included. In addition, the occupational definitions adopted for wage rate analysis may be more restrictive than needed for occupational analysis.

Until the effects of the various exclusions can be evaluated, employment estimates for individual occupations derived from CWS data are of doubtful value. However, annual data, if available for a number of years, may provide useful indications to overall trends in employment for specific occupations in particular industries.

## Industry Wage Surveys

The Bureau of Labor Statistics also conducts industry wage surveys on a sample basis for particular industries at regular recurring intervals. Most of these surveys are scheduled to be conducted on a 5-year cycle; the remainder on either a 3-year or annual basis. In most of these studies, the detailed data, collected by personal visits of field economists, are limited to selected production worker occupations concentrated in the industry being studied, or perhaps, found exclusively in that industry. The reports contain estimates of total employment for establishments within the scope of the survey, and of all production workers in the case of studies of manufacturing industries. Occasionally, data on wage rates and number of employees are also gathered for a small number of office worker occupations.

The usefulness of occupational employment data contained in a specific wage study depends on a number of factors. Foremost among these is the comparability between the industry coverage in a particular survey and the most nearly similar industry for which total employment data are available. Small size plants are almost always excluded and parts of industries are sometimes excluded. If total (or production worker) employment within the scope of the wage survey were only a small portion of total (or production worker) employment in the industry, the occupational data are probably not very useful.

Other factors which determine the usefulness of industry wage surveys for deriving occupational employment estimates for entire industries are the geographical coverage and the minimum size of the establishments included, measured in terms of employment. The size of the establishments excluded ranges from those with fewer than 4 employees to those with fewer than 100 employees, depending on the structure of the industry surveyed. Most frequently, the establishments surveyed are selected from those employing 20 or more workers.

Separate auxiliary units, such as central offices, are usually excluded from the industry wage surveys. In some studies, research laboratories, warehouses, or other units are excluded. Obviously, the occupational composition of the excluded units is somewhat different from those units covered in the study. However, since employment data are obtained only for production worker occupations, there is a reasonable solution to this problem. Relatively few production workers (outside of custodial workers) are employed in the excluded units, with the possible exception of warehouses. Therefore, the employment data for specific occupations may be inflated by the proportionate difference between the production worker total within the scope of the industry wage study and the production worker total reported in the BLS Industry Employment Series for the industry concerned, when that difference is relatively small. The definition of production workers used in the wage surveys is the same as that used in the BLS Industry Employment Statistics. Since 1957, the industry employment within the scope of the various industry wage surveys has ranged from 20 percent for auto dealer repair shops to 99 percent for cigarettes (table 19).

More difficult to solve is the problem posed by restrictions in the general definition which applies to all occupations selected for study in the industry wage surveys. Working supervisors, apprentices, learners, beginners, trainees, handicapped, part-time, temporary and probationary workers, and others subject to special pay rates are excluded from the data for selected occupations, although they are included in the data for all production workers. This practice differs from the accepted practice of tabulating occupational employment data, in that these workers are usually included in the count for their specific occupation, except that apprentices are tabulated separately by skill. Also, the occupational definitions adopted for wage surveys may be more specific than those used in other collection programs, such as the population census. No research has been done to evaluate the importance of these exclusions. However, it is believed that useful occupational data can be obtained from surveys which cover high proportions of industry employment.

It should be kept in mind that industry wage surveys will not give complete occupational patterns for an industry, because they give detailed occupational employment information for only a select group of production workers. In no case does an industry wage survey provide complete coverage for all production worker occupations.

Table 20 lists occupations which covered more than 10,000 employees within specified industries at the time the latest industry wage surveys were conducted in these industries.

Regional and area studies

- 1/ Proportion production workers covered by scope of industry wage survey are of production workers reported in the BLS payroll employment series ("Employment and Earnings Statistics") for the same time period.
- 2/ Proportion total employment covered by scope of industry wage survey is of total employment reported in the BLS payroll employment series for same time period.
- 3/ Percent total employment within the scope of the survey is to total workers reported in the 1963 Census of Business.

Note: The communications industry wage surveys are not included in this table as they are included with regulatory agency data.

Table 20. Occupational Employment Data Obtained from Selected Industry  
Wage Surveys--Continued

Occupation <u>1/</u>	Industry	Year studied (latest)	Reported employ- ment	Estimated employ- ment <u>2/</u>
Packers, hand (fancy and bulk) - - - - -	Candy and other confectionery Men's and boys' suits and coats Hosiery	1960 1963 1964	10,040 10,319 9,850	11,300 11,200 10,200
Presser and underpresser - - - - -				
Loopers, toe - - - - -				

1/ Occupations with estimated employment of 10,000 or more within specific industries covered by Industry Wage Surveys. Excludes occupations covered by Community Wage Surveys.

2/ Reported employment inflated to account for the percent of total industry employment not within the scope of the industry wage survey as shown in table 19.

3/ Estimated employment in selected occupations concentrated in the textile industry are derived from three separate industry wage surveys--Cotton Textiles, May 1963; Synthetic Textiles, May 1963; and Wool Textiles, June 1962.

## Surveys of Professional, Administrative, Technical, and Clerical Pay

The Bureau of Labor Statistics surveys of professional, administrative, technical, and clerical pay include the following occupations not covered in the Community Wage Surveys:

- Accountants and auditors
- Attorneys
- Chemists
- Engineers
- Engineering technicians
- Job analysts
- Directors of Personnel
- Managers, office services

Collection is limited to the same metropolitan areas and industries covered by the CWS. Only units with 250 employees or more, are surveyed. In 1964, the sample for professional and administrative occupations included about 1,800 establishments, almost all of which were also in the CWS sample. Because of the limited sample size for many industries, and the exclusion of units with fewer than 250 employees, it is doubtful that reliable estimates of occupational employment are obtained.

### Local Area Occupational Information

Occupational employment information, other than that in the population censuses, has been gathered for a large number of local labor areas. The data are valuable for manpower analysis of the areas surveyed, but are generally of limited assistance in making national estimates.

Since 1956, Area Skill Surveys have been made for over 160 local labor areas by State Departments of Labor or local Employment Service offices, frequently with sponsorship of local agencies such as Chambers of Commerce. Technical assistance and funds are provided by the U.S. Bureau of Employment Security. Some of the Area Skill Surveys contain demand and supply information for specific occupations or occupational groups, showing current employment, growth in employment expected, estimated attrition, local new entrants needed, and estimates of the future labor supply. However, the areas surveyed are not selected to be representative of the entire country, the surveys are not undertaken at regular intervals, and the amount of information provided varies greatly from area to area. The number of occupations for which data are gathered ranges from a half dozen to over a thousand. In a few of the skill surveys, occupational distributions are shown for specific industries. These data are usually not in great detail.

Occupational Guides (published as Guide to Local Occupational Information), each referring to a single occupation or occupation group in a local area, provide information on the numbers employed as well as other characteristics of the occupation. Since 1955, over 1,500 Guides have been prepared by the various State Employment Service agencies. A listing of the Area Skill Surveys and Occupational Guides completed through 1964 is contained in Job Opportunities Information of February 1965. 18/

In addition to the Area Skill Surveys, and Occupational Guides, at least a few other studies provide data on employment by occupation in state or local labor areas. Probably the most important, in terms of the number of workers covered and the occupations surveyed are studies by the New York State Department of Labor. In a 1962 survey, data were collected on the employment in New York of scientists, engineers and 15 technical occupations. Detailed information was also developed on the skill requirements and other characteristics of employment in technical occupations. 19/ Earlier surveys by the State of New York provide information on employment and the outlook for metalworking craftsmen 20/ and for 36 professional, technical, skilled and semiskilled occupations in electronics manufacturing. 21/

18/ Job Opportunities Information, U.S. Department of Labor, Bureau of Employment Security, February 1965.

19/ Technical Manpower in New York State, New York State, Department of Labor, Division of Research and Statistics, 1964.

20/ Manpower in Selected Metal Crafts, New York State, State of New York, Department of Labor.

21/ Manpower Requirements in Electronics Manufacturing--outlook to 1964 in the New York Metropolitan Area, New York State Department of Labor, 1960.

Appendix A. Estimated Employment by Occupation from All Sources,  
Other Than the Population Census

The accompanying table brings together employment data by detailed occupation published by various sources other than the decennial census, for the years 1960-65. It is not all inclusive. As a practical consideration, occupational employment statistics which cover only comparatively few workers have been omitted. Employment data from one source which duplicate more comprehensive data from another source also have been excluded. Despite the omissions, the table presents a useful unduplicated count of available detailed occupational employment data.

Appendix Table 1. Estimated Employment by Occupation (from Sources Other Than the Population Census), U.S., 1960-65

Note: Concepts relating to occupational data compiled by different sources tend to vary with respect to time (e.g., annual average versus employment in a single month), coverage (e.g., all employees, full-time equivalents, etc.), and in other ways. The reader is cautioned, therefore, to familiarize himself with the different concepts as explained in the discussion of each source, or by examining the basic reports, before using these data.

Footnote references are to general sources of statistics.
